Four Points to Consider When Setting a Retirement Income Goal

No matter what your age or stage of life, targeting a goal for monthly retirement income can seem like a daunting task. Following are four considerations to help you get started.

1. When do you plan to retire

The first question to ponder is your anticipated retirement age. Many people base their target retirement date on when they're eligible for full Social Security benefits, and for today's workers, "full retirement age" ranges from 66 to 67. Other folks hope to retire early, while others want to work as long as possible. As you think about your anticipated retirement date, keep the following points in mind.

If you plan to retire early, you'll need significant resources to provide income for potentially decades. You can typically tap your employer-sponsored retirement plan without penalty as early as age 55 if you terminate your employment, but if you try to access IRA assets prior to age 59½, you will be subject to a 10% early withdrawal penalty, unless an exception applies. In both cases, regular income taxes will apply. Also consider that you generally won't be eligible for Medicare until age 65, so unless you are one of the lucky few who have employer-sponsored retiree medical benefits, health insurance will have to be funded out of pocket.

If you plan to delay retirement, consider that unexpected circumstances could throw a wrench in that plan. In its 2017 Retirement Confidence Survey, the Employee Benefit Research Institute (EBRI) found that current workers plan to retire at a median age of 65, while current retirees reported a median retirement age of 62. And although four in 10 workers plan to work until age 70 or later, just 4% of retirees said this was the case. Why the difference? Nearly half of retirees said they retired earlier than planned, with many reporting unexpected challenges, including their own health concerns or those of a family member.¹

2. How long will your retirement last

The second important consideration, which builds on the first, is how long your retirement might last. Projected life spans have been lengthening in recent decades due in part to advancements in medical care and general health awareness. According to the National Center for Health Statistics (NCHS), a 65-year-old woman can expect to live 20.6 more years, while a 65-year-old man can

expect to live 18 more years.² To estimate your own life expectancy based on your current age and health profile, visit the online longevity calculator created by the Society of Actuaries and American Academy of Actuaries at longevityillustrator.org.

3. What will your expenses look like

The third consideration is how much you will need to meet your basic living expenses. Although your housing, commuting, and other work-related expenses may decrease in retirement, other costs — including health care — will likely rise.

In 2017, EBRI calculated that Medicare recipients with median prescription drug expenses may need about \$265,000 just to pay for basic medical expenses in retirement.³ And that doesn't even include the potential for long-term care. According to the Department of Health and Human Services (HHS), 52% of people over age 65 will need some form of long-term care during their lifetimes, which could add another \$69,000, on average, to the out-of-pocket costs.⁴

In addition, remember to account for the impact inflation will have on your expenses over time. For example, say you need an estimated \$50,000 to cover basic needs in your first year of retirement. Ten years later, at a 3% annual inflation rate (the approximate historical average as measured by the consumer price index), you would need more than \$67,000 to cover those same costs.

4. How much can you accumulate

This is perhaps the most important consideration: How much can you *realistically* accumulate between now and retirement based on your current savings rate, timeframe, investment portfolio, and lifestyle? Once you project your total accumulation amount based on current circumstances, you can gauge whether you're on track or falling short. And if you appear to be falling short, you can begin to think about how to refine your strategy, either by altering your plans for retirement (e.g., delaying retirement by a few years), saving more, or investing more aggressively.

Investing to Save Time Boosts Happiness Returns

The more money you make, the more valuable you perceive your time to be — and the more time-strapped you may feel, according to University of British Columbia psychology professor Elizabeth Dunn.¹ So wouldn't it stand to reason that if you use some of your hard-earned money to buy yourself more time — for example, by paying someone to clean your house or mow your lawn — you might achieve a greater level of happiness? Indeed, that was the primary finding in a series of studies by Professor Dunn and other researchers published in the Proceedings of the National Academy of Sciences (PNAS).²

The discovery

The study's authors surveyed 6,000 individuals at diverse income levels in multiple countries, including the United States, Canada, the Netherlands, and Denmark. The surveys queried participants about whether they spent money on a monthly basis to hire others to take care of unpleasant or time-consuming daily tasks or chores — such as cleaning, yard work, cooking, and errand-running — and if so, how much they spent. Respondents were also asked to rate their "satisfaction with life" and report demographic information, such as their income level and whether they were married and had children.

Researchers found that across all national samples, 28.2% of respondents spent an average of about \$148 per month to outsource disliked tasks, while in the United States, 50% of respondents spent an average of \$80 to \$99 on services that save time. Across all studies, those who spent money to outsource disliked tasks and/or save time had a stronger life satisfaction rating. Findings were consistent across income spectrums; in fact, in the United States, researchers found a stronger correlation among the less-affluent respondents. The authors noted, however, that their studies did not include enough people at the lowest end of the income spectrum to attribute similar findings to this group.

Of course, correlation does not necessarily indicate causality, so the researchers designed a follow-up experiment to further test their hypothesis.

In this experiment, researchers gave a group of 40 adults \$80 each to spend over the course of two weekends. During the first weekend, they were to spend \$40 on something that would save them time, such as ordering groceries online and having them delivered. On the second weekend, they were directed to spend \$40 on a nice material purchase, such as clothes, board games, or a bottle of wine. On

average, those who spent money to save time reported better moods at the end of the day than those who purchased material goods. And according to the researchers, over time, the effect of regular mood boosts can add up to greater overall satisfaction with life.

In a third study, researchers asked respondents how they would spend an extra \$40. Just 2% indicated they would use the unexpected bonus to invest in time-saving services.

Perhaps most surprising of all the findings? Researchers polled 800 millionaires from the Netherlands about whether they spent money to save time. Despite the fact that these individuals could readily afford to hire others to take care of time-consuming tasks, only about half of them reported doing so on a monthly basis. Researchers surmise that the reason might be because such individuals feel guilty or don't want to be perceived as lazy for outsourcing chores they can easily do themselves.

The lesson

"If you have a lot of money and a lot of nice stuff, but you're spending your time doing things that you dislike, then your minute-to-minute happiness and overall happiness is likely to be pretty low," said Dunn in an interview about the research.³ In the PNAS report, the study's authors contend that this may be especially true for women:

"Within many cultures, women may feel obligated to complete household tasks themselves, working a 'second-shift' at home, even when they can afford to pay someone to help. In recent decades, women have made gains, such as improved access to education, but their life satisfaction has declined; increasing uptake of time-saving services may provide a pathway toward reducing the harmful effects of women's second shift."

The bottom line? If you can afford it, don't shy away from spending money to save time. Doing so is an investment that provides immeasurable returns in the form of overall well-being.

Now that it's fairly common for families to have two wage earners, many husbands and wives are accumulating assets in separate employer-sponsored retirement accounts. In 2018, the maximum employee contribution to a 401(k) or 403(b) plan is \$18,500 (\$24,500 for those age 50 and older), and employers often match contributions up to a set percentage of salary.

But even when most of a married couple's retirement assets reside in different accounts, it's still possible to craft a unified retirement strategy. To make it work, open communication and teamwork are especially important when it comes to saving and investing for retirement.

Retirement for two

Tax-deferred retirement accounts such as 401(k)s, 403(b)s, and IRAs can only be held in one person's name, although a spouse is typically listed as the beneficiary who would automatically inherit the account upon the original owner's death. Taxable investment accounts, on the other hand, may be held jointly.

Owning and managing separate portfolios allows each spouse to choose investments based on his or her individual risk tolerance. Some couples may prefer to maintain a high level of independence for this reason, especially if one spouse is more comfortable with market volatility than the other.

However, sharing plan information and coordinating investments might help some families build more wealth over time. For example, one spouse's workplace plan may offer a broader selection of investment options, or the offerings in one plan might be somewhat limited. With a joint strategy, both spouses agree on an appropriate asset allocation for their combined savings, and their contributions are invested in a way that takes advantage of each plan's strengths while avoiding any weaknesses.

Asset allocation is a method to help manage investment risk; it does not guarantee a profit or protect against loss.

Spousal IRA opportunity

It can be difficult for a stay-at-home parent who is taking time out of the workforce, or anyone

who isn't an active participant in an employer-sponsored plan, to keep his or her retirement savings on track. Fortunately, a working spouse can contribute up to \$5,500 to his or her own IRA and up to \$5,500 more to a spouse's IRA (in 2018), as long as the couple's combined income exceeds both contributions and they file a joint tax return. An additional \$1,000 catch-up contribution can be made for each spouse who is age 50 or older. All other IRA eligibility rules must be met.

Contributing to the IRA of a nonworking spouse offers married couples a chance to double up on retirement savings and might also provide a larger tax deduction than contributing to a single IRA. For married couples filing jointly, the ability to deduct contributions to the IRA of an active participant in an employer-sponsored plan is phased out if their modified adjusted gross income (MAGI) is between \$101,000 and \$121,000 (in 2018). There are higher phaseout limits when the contribution is being made to the IRA of a nonparticipating spouse: MAGI between \$189,000 and \$199,000 (in 2018).

Thus, some participants in workplace plans who earn too much to deduct an IRA contribution for themselves may be able to make a deductible IRA contribution to the account of a nonparticipating spouse. You can make IRA contributions for the 2018 tax year up until April 15, 2019.

Withdrawals from tax-deferred retirement plans are taxed as ordinary income and may be subject to a 10% federal income tax penalty if withdrawn prior to age 59½, with certain exceptions as outlined by the IRS.

Savings Gap

Despite career gains, women tend to retire with fewer assets than men.

The information in these materials may change at any time and without notice.

What is the employment situation report, and why is it important to investors?

Each month, the Bureau of Labor Statistics publishes the Employment Situation Summary report based on information from the prior month. The data for the report is derived primarily from two sources: a survey of approximately 60,000 households, or about 110,000 individuals (household survey), and an establishment survey of over 651,000 worksites.

Results from each survey provide information about the labor sector, including the:

- Total number of employed and unemployed people
- Unemployment rate (the percentage of the labor force that is unemployed)
- Number of people working full- or part-time in U.S. businesses or for the government
- Average number of hours worked per week by nonfarm workers
- Average hourly and weekly earnings for all nonfarm employees

According to the Bureau of Labor Statistics, when workers are unemployed, they, their

families, and the country as a whole can be negatively impacted. Workers and their families lose wages, and the country loses the goods or services that could have been produced. In addition, the purchasing power of these workers is lost, which can lead to unemployment for yet other workers.

Investors pay particular attention to the information provided in this report. For instance, a decreasing unemployment rate may indicate an expanding economy and potentially rising interest rates. In this scenario, stock values may rise with expanding corporate profits, while bond prices may fall for fear of rising interest rates. Advancing wages may also be a sign of higher inflation and interest rates, as well as greater economic productivity.

Generally, the Employment Situation Summary report provides statistics and data on the direction of wage and employment trends — information that can be invaluable to investors.

What is gross domestic product, and why is it important to investors?

GDP, or gross domestic product, measures the value of goods and services produced by a nation's

economy less the value of goods and services used in production. In essence, GDP is a broad measure of the nation's overall economic activity and serves as a gauge of the country's economic health. Countries with the largest GDP are the United States, China, Japan, Germany, and the United Kingdom.

GDP generally provides economic information on a quarterly basis and is calculated for most of the world's countries, allowing for comparisons among various economies.

Important information that can be gleaned from GDP includes:

- A measure of the prices paid for goods and services purchased by, or on behalf of, consumers (personal consumption expenditures), including durable goods (such as cars and appliances), nondurable goods (food and clothing), and services (transportation, education, and banking)
- Personal (pre-tax) and disposable (after-tax) income and personal savings

- Residential (purchases of private housing) and nonresidential investment (purchases of both nonresidential structures and business equipment and software, as well as changes in inventories)
- Net exports (the sum of exports less imports)
- Government spending on goods and services

GDP can offer valuable information to investors, including whether the economy is expanding or contracting, trends in consumer spending, the status of residential and business investing, and whether prices for goods and services are rising or falling. A strong economy is usually good for corporations and their profits, which may boost stock prices.

Increasing prices for goods and services may indicate advancing inflation, which can impact bond prices and yields. In short, GDP provides a snapshot of the strength of the economy over a specific period and can play a role when making financial decisions. All investing involves risk, including the possible loss of principal, and there is no guarantee that any investment strategy will be successful.
