

4. Invest for the Long Term

A long-term perspective is one of the most important ingredients of portfolio success. But the powerful emotions we experience when markets move up and down can get in our way. That's why we use the latest behavioral research to help you make better decisions and stay on track. We also rebalance your portfolio periodically to keep it aligned with your goals.

Average Investors Underperform Major Indices 1997 – 2016

Average stock investor and average bond investor performances were used from a DALBAR study, Quantitative Analysis of Investor Behavior (QAIB), 03/2017. QAIB calculates investor returns as the change in assets after excluding sales, redemptions, and exchanges. This method of calculation captures realized and unrealized capital gains, dividends, interest, trading costs, sales charges, fees, expenses, and any other costs. After calculating investor returns in dollar terms (above), two percentages are calculated: Total investor return rate for the period and annualized investor return rate. Total return rate is determined by calculating the investor return dollars as a percentage of the net of the sales, redemptions, and exchanges for the period.

The fact that buy-and-hold has been a successful strategy in the past does not guarantee that it will continue to be successful in the future. Equities, bonds, and other asset classes have different risk profiles, which should be considered when investing. Bonds are subject to market and interest rate risk. Bond values will decline as interest rates rise and/or issuer's creditworthiness declines, and are subject to availability and changes in price. Stock investing involves risks, including increased volatility (up and down movement in the value of your assets) and loss of principal.

The S&P 500 is an index of 500 stocks chosen for market size, liquidity and industry grouping, among other factors. The S&P 500 is designed to be a leading indicator of U.S. equities and is meant to reflect the risk/return characteristics of the large cap universe. The Barclays Bond Index covers the USD-denominated, investment-grade, fixed-rate, taxable bond market of SEC-registered securities. The index includes bonds from the Treasury, Government-Related,

INVESTED IN YOUR GOALS

4 Steps to an Effective Portfolio

FOCUSED ON INVESTING

We believe your portfolio should be designed to give you the highest probability of achieving your goals with a suitable amount of risk.

4 Steps to an Effective Portfolio

Investing makes it possible for many of us to achieve important lifetime goals, such as retirement. That's why we employ an investment approach based on almost nine decades of data, analysis and research, insights from behavioral finance and close relationships with leading academics. There are four key concepts which play a vital role in the construction and management of our portfolios. Together, they add up to a distinctive long-term, approach we call Asset Class Investing.

1. Let Markets Work for You

Instead of trying to beat the market, let the long-term growth potential of markets around the world work for you. Over time, markets have significantly outperformed inflation, yet most active money managers have consistently failed to outperform markets.¹ This is why we use strategic Asset Class investments, which let markets work for you by focusing on delivering market returns.

In the short-term markets go up and down all the time, but \$1 invested in the U.S. Stock market in 1927 grew to \$5,105 by 2016. That's the power of free markets, powered by human innovation.

Markets have been significant generators of long-term wealth for investors

2. Put Science On Your Side

Using the knowledge and tools provided by financial science, we build portfolios with focused exposure to key “factors” of returns, such as company size, relative price (value), profitability and momentum. This exposure largely determines a portfolio's risk and return. Working together, we then decide how much exposure to such factors is right for your situation and long-term goals.

greater potential risk = greater expected long-term returns

3. Manage Risks

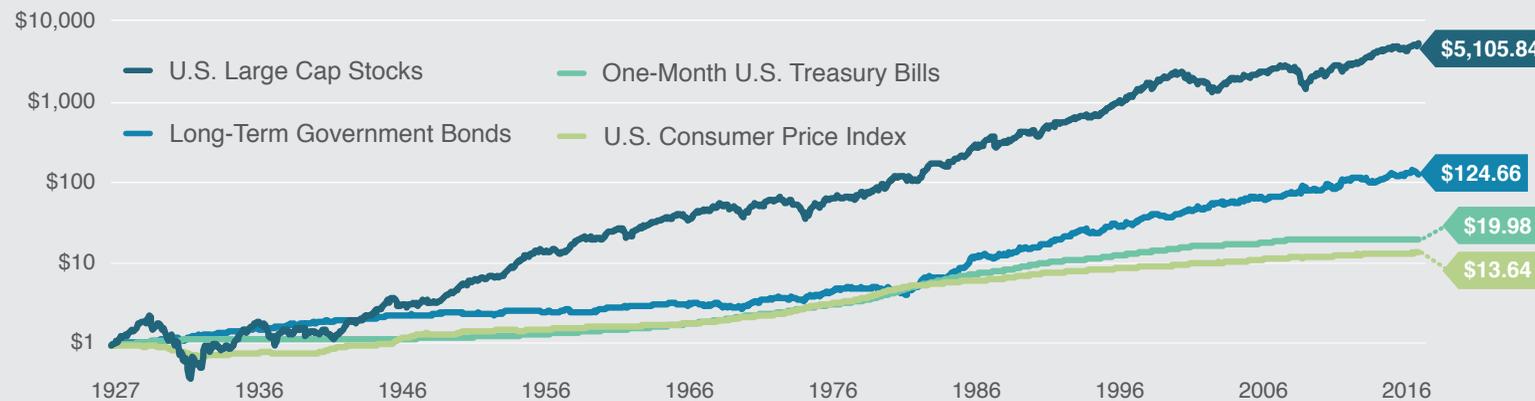

Risk can't be eliminated, but it can be managed — even potentially reduced — through our prudent approach:

- We diversify globally (almost 50% of world stock market value is non-U.S.)
- We invest in thousands of securities to reduce company-specific risk
- We invest in high-quality, short-term bonds to provide income and help smooth out dramatic ups and downs
- We combine asset classes that respond differently to various market conditions

The portfolios we build have 9 asset classes representing up to 10,000 securities in 42 countries and 30 currencies.

Smart diversification can help you stay on track

Growth of \$1 Jan. 1927 – Dec. 2016

Hypothetical value of \$1 invested at the beginning of 1927 and kept invested through December 31, 2016. Assumes reinvestment of income and no transaction costs or taxes. This is for illustrative purposes only and not indicative of any investment. Total returns in U.S. dollars. Past performance is no guarantee of future results.

U.S. Large Cap Stocks represented by the S&P 500 U.S. Large Company Stock Index, which is an unmanaged index of stocks of large U.S. companies. The Consumer Price Indexes (CPI) program produces monthly data on changes in the prices paid by urban consumers for a representative basket of goods and services. Long-Term Government Bonds, One-Month U.S. Treasury Bills, and U.S. Consumer Price Index (inflation), source: Morningstar's 2016 Stocks, Bonds, Bills, And Inflation Yearbook (2016). Indexes are unmanaged baskets of securities that investors cannot directly invest in. Index performance does not reflect the fees or expenses associated with the management of an actual portfolio.

Risks associated with investing in stocks potentially include increased volatility (up and down movement in the value of your assets) and loss of principal. T Bills and government bonds are backed by the U. S. government and guaranteed as to the timely payment of principal and interest. T Bills and government bonds are subject to interest rate and inflation risk and their values will decline as interest rates rise.
